this handbook is inspired by occasional questions from my students and coworkers as to how they can obtain easily the best network functions from which they can complete their filter design projects to satisfy certain criteria they don't need any help to design the filter they need only the network function it appears that this crucial step can be a bottleneck to designers this handbook is meant to supply the information for those who need a quick answer to a simple question of this kind there are three most useful basic standard low pass magnitude characteristics used in filter design these are the butterworth the chebyshev and the elliptic characteristics the butterworth characteristic is maximally flat at the origin the chebyshev characteristic gives equal ripple variation in the pass band the elliptic characteristic gives equal ripple variation in both the pass band and the stop band the butterworth and the chebyshev characteristics are fairly easy to use and formulas for their parameters are widely available and fairly easy to apply the theory and derivation of formulas for the elliptic characteristic however are much more difficult to handle and understand this is chiefly because their original development made use of the jacobian elliptic functions which are not familiar to most electrical engineers although there are several other methods of developing this characteristic such as the potential analogy the chebyshev rational functions and numerical techniques most filter designers are as unfamiliar with these methods as they are with the elliptic functions

lognormal distributions are one of the most commonly studied models in the statistical literature while being most frequently used in the applied literature the lognormal distributions have been used in problems arising from such diverse fields as hydrology biology communication engineering environmental science reliability agriculture medical science mechanical engineering material science and pharmacology though the lognormal distributions have been around from the beginning of this century see chapter 1 much of the work concerning inferential methods for the parameters of lognormal distributions has been done in the recent past

most of these methods of inference particularly those based on censored samples involve extensive use of numerical methods to solve some nonlinear equations order statistics and their moments have been discussed quite extensively in the literature for many distributions it is very well known that the moments of order statistics can be derived explicitly only in the case of a few distributions such as exponential uniform power function pareto and logistic in most other cases including the lognormal case they have to be numerically determined the moments of order statistics from a specific lognormal distribution have been tabulated earlier however the moments of order statistics from general lognormal distributions have not been discussed in the statistical literature until now primarily due to the extreme computational complexity in their numerical determination
