a goal of mine ever since becoming an educational researcher has been to help construct a sound theory to guide instructional practice for far too long educational practice has suffered because we have lacked firm instructional guidelines which in my view should be based on sound psychological theory which in turn should be based on sound neurological theory in other words teachers need to know how to teach and that how to teach should be based solidly on how people learn and how their brains function as you will see in this book my answer to the question of how people learn is that we all learn by spontaneously generating and testing ideas idea generating involves analogies and testing requires comparing predicted consequences with actual consequences we learn this way because the brain is essentially an idea generating and testing machine but there is more to it than this the very process of generating and testing ideas results not only in the construction of ideas that work i e the learning of useful declarative knowledge but also in improved skill in learning i e the development of improved procedural knowledge

developmental biology is seemingly well understood with development widely accepted as being a series of programmed changes through which an egg turns into an adult organism or a seed matures into a plant however the picture is much more complex than that is it all genetically controlled or does environment have an influence is the final adult stage the target of development and everything else just a build up to that point are developmental strategies the same in plants as in animals how do we consider development in single celled organisms in this concise engaging volume alessandro minelli a leading developmental biologist addresses these key questions using familiar examples and easy to follow arguments he offers fresh alternatives to a number of preconceptions and stereotypes awakening the reader to the disparity of developmental phenomena across all main branches of the tree of life
